The **CD1110** of dynamic torque sensors have extremely low operating ranges protected by mechanical stops permitting an overload of 10 times the measurement range.

The rugged design provides accurate bidirectional torque measurements at rotary speed up to 2000 rpm.

As option, the **CD1110** can receive an on-board amplifier for high-level voltage output. Signal amplification is accomplished before transmission via the slip ring assembly, thus eliminating the noise generated by the contacts. It is also possible to eliminate the contact residual drag torque by placing the transducer sensing element directly in contact with the torque to be measured.

With a long standing experience as a designer and manufacturer of sensors, TE CONNECTIVITY often works with customers to design or customize sensors for specific uses and testing environments.

On request, Instruction documents can be provided to ease the selection and use of our sensors and provide helpful tips.
